Task 2: Data Visualization and Storytelling

Supermart Grocery Sales Dataset | Visual Report

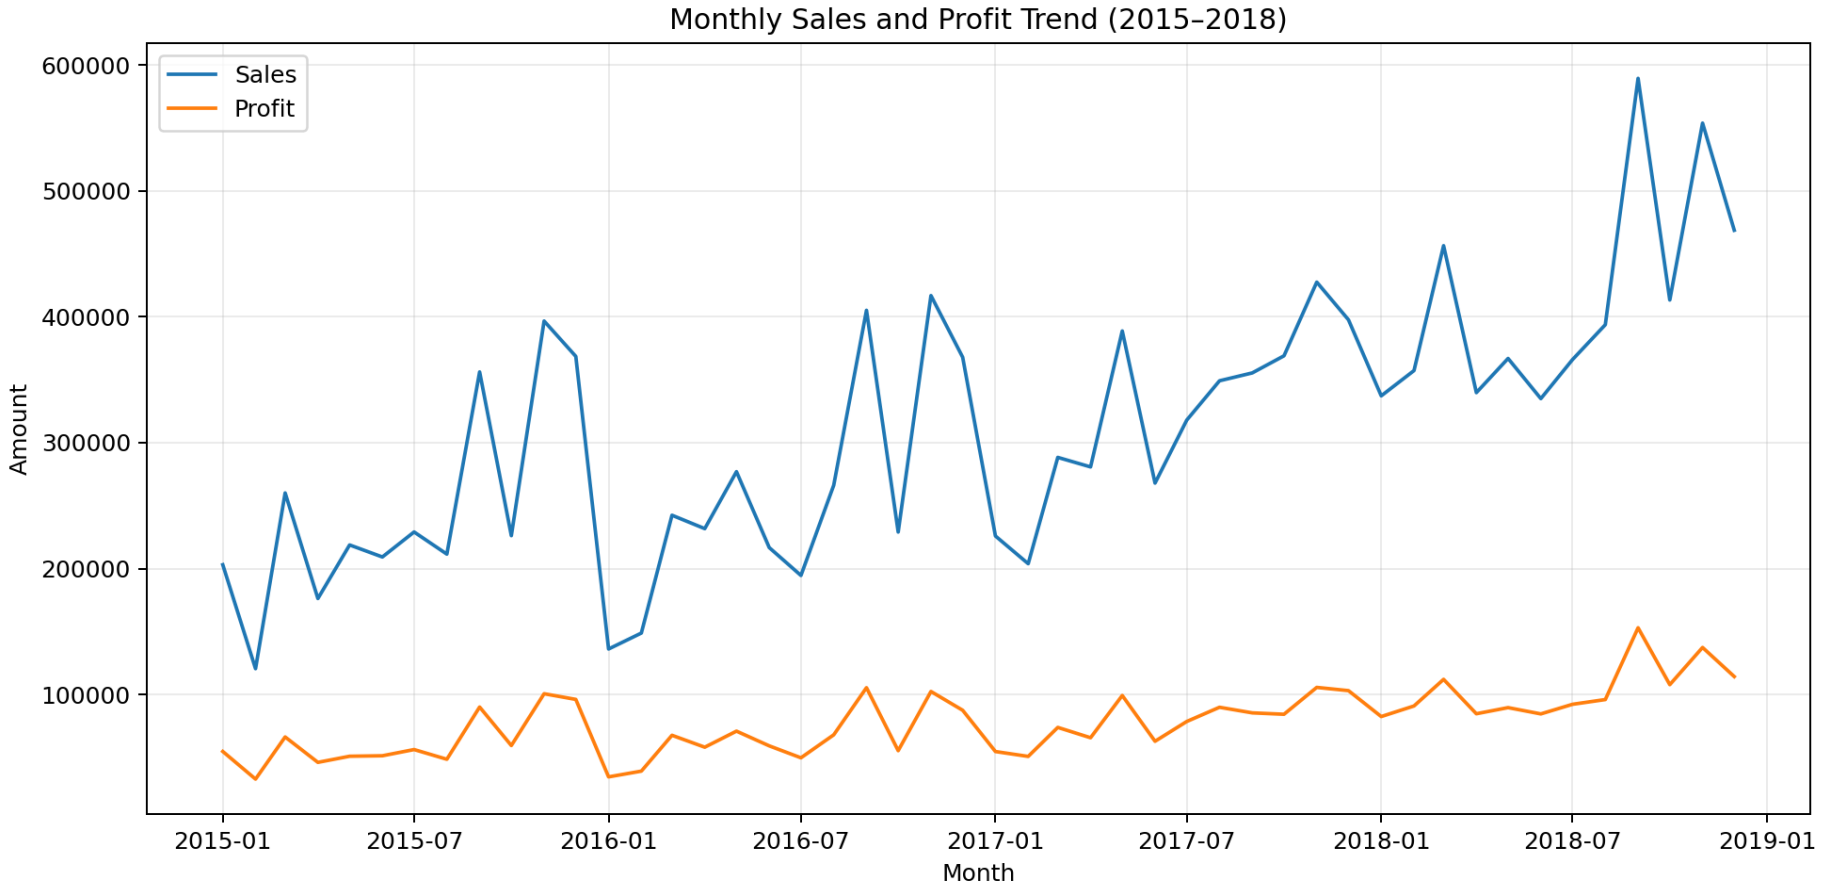

Objective: Create visualizations that convey a compelling story using charts, context and business insights.

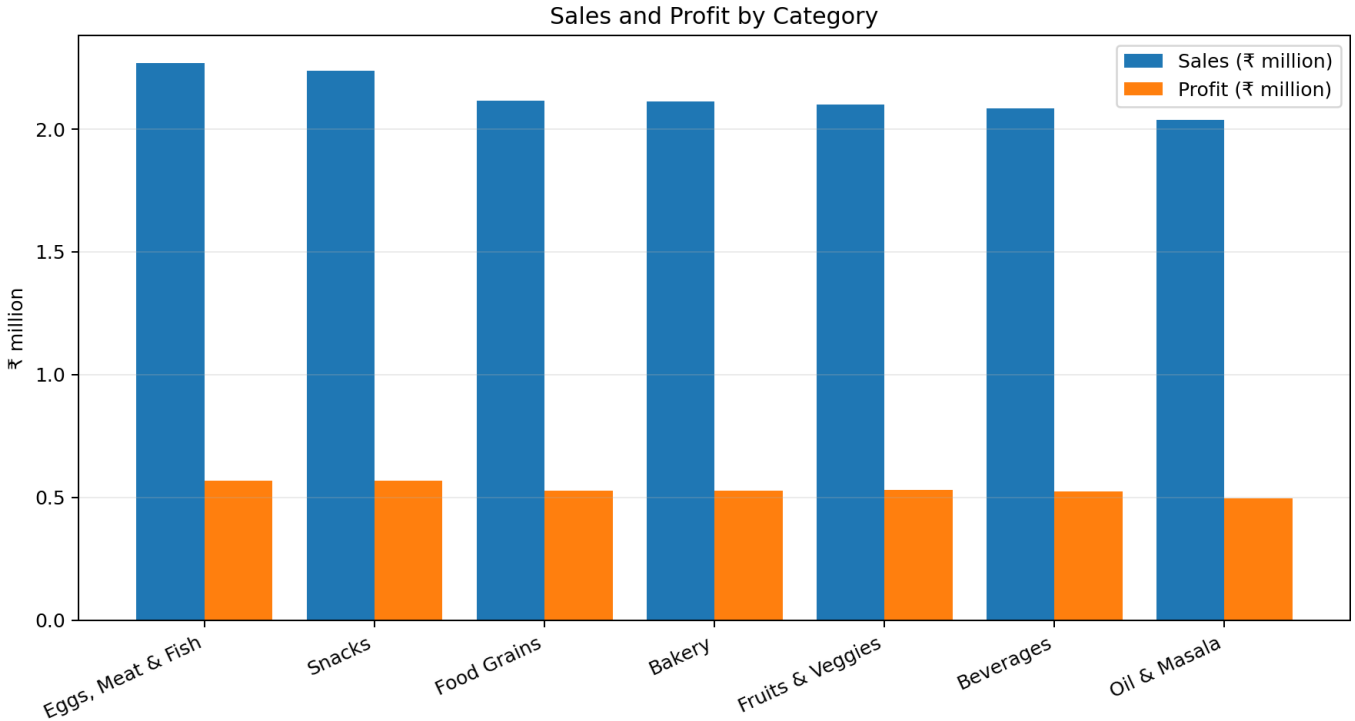

1. Key Performance Overview

Metric	Value	Metric	Value
Total Sales	■14,956,982	Total Profit	■3,747,121
Profit Margin	25.05%	Average Discount	22.68%
Unique Orders	9,994	Data Period	02-01-2015 to 30-12-2018

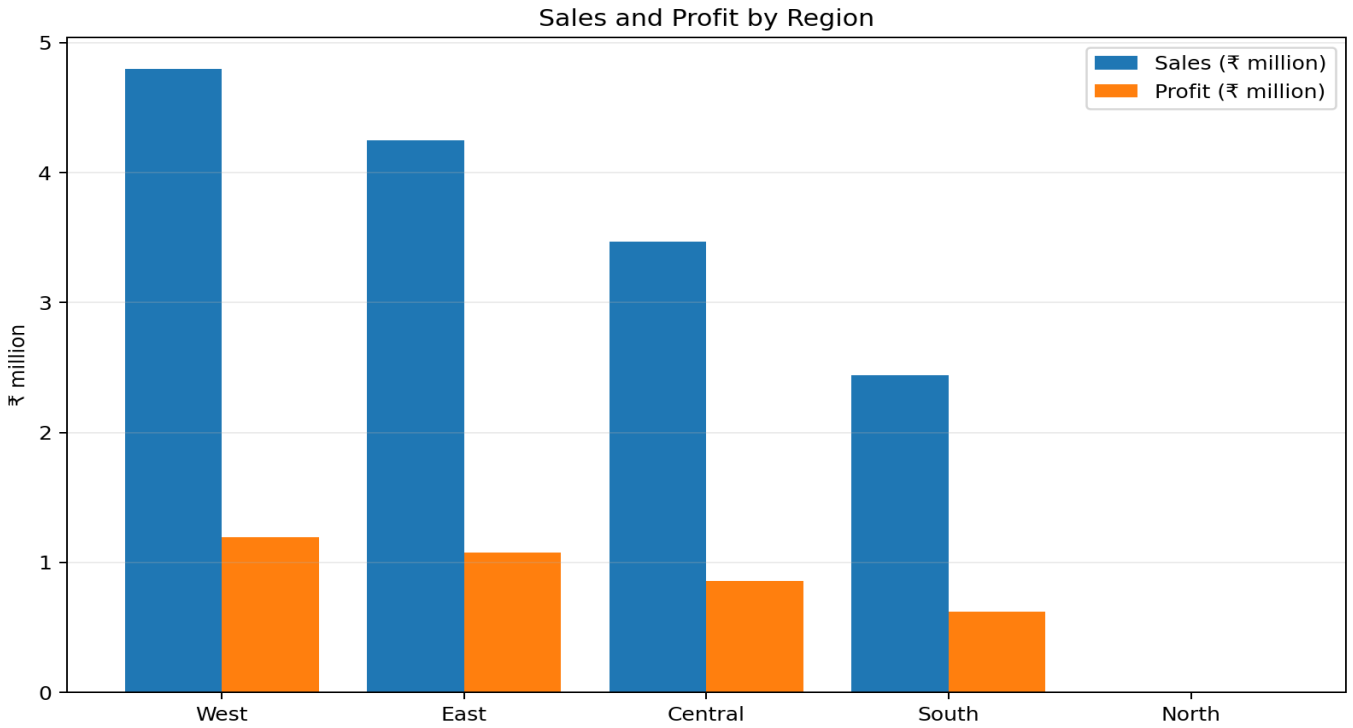

The dataset contains 9,994 cleaned records. Overall sales are about ■14.96 million and profit is about ■3.75 million, giving an overall profit margin of about 25.05%.

2. Category and Regional Story

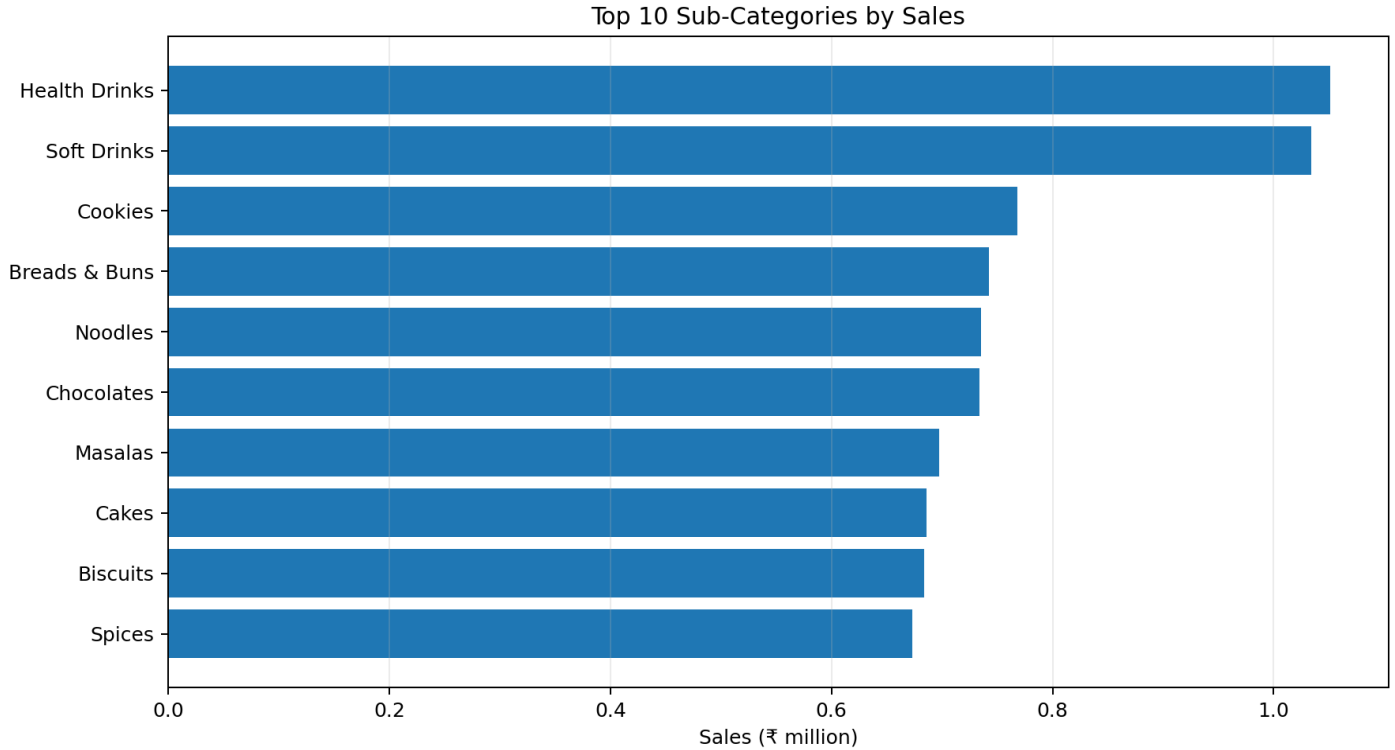

Category insight: Eggs, Meat & Fish has the highest sales at ■2,267,401. Snacks is next at ■2,237,546.

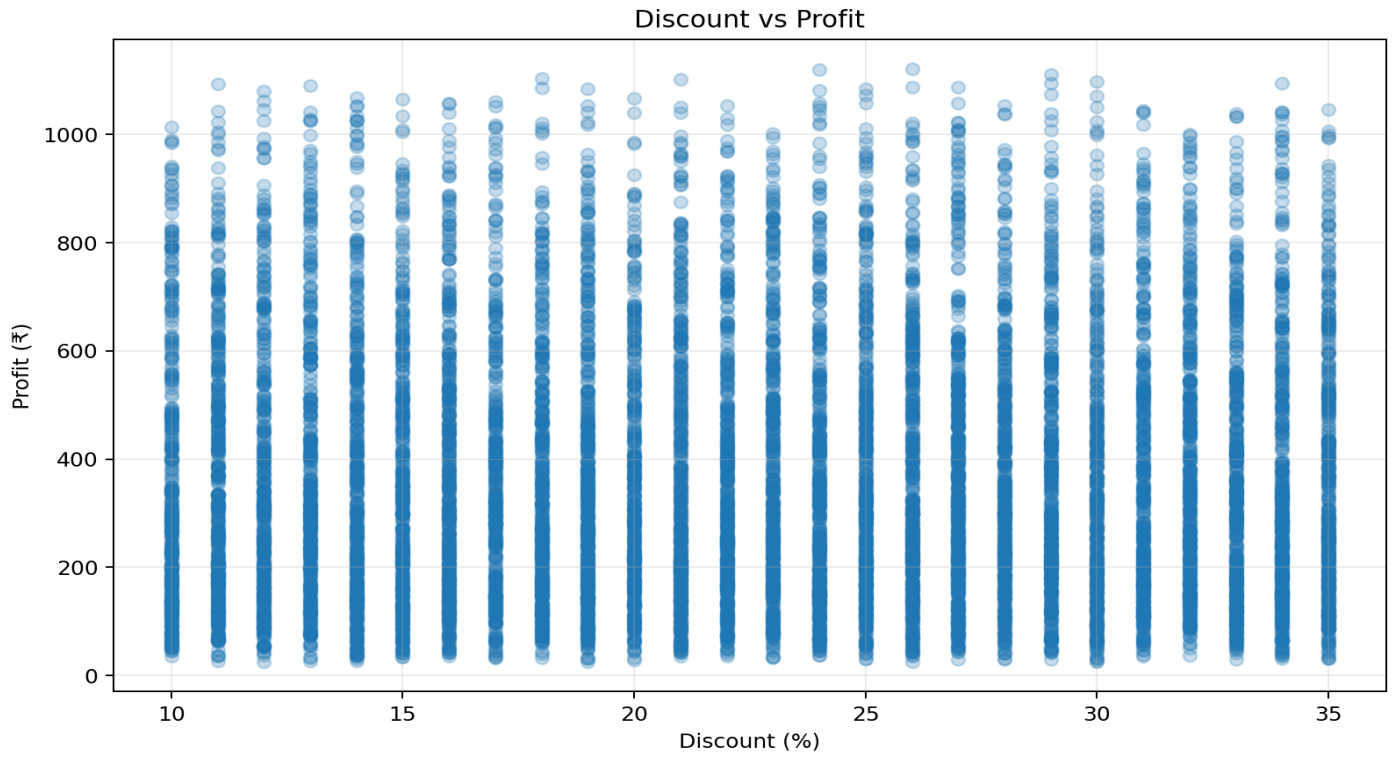

Regional insight: West has the highest sales at ■4,798,743. The North region has only ■1,254 in the dataset, so its very small value should be treated as a data-coverage observation rather than a broad market conclusion.

3. Product and Discount Analysis

Top sub-category: Health Drinks records the highest sales among sub-categories at ■1,051,439.

The discount-versus-profit chart is used to inspect whether higher discounts are associated with lower profit values. The chart shows the transaction-level distribution; it should be interpreted as an exploratory relationship, not proof of causation.

4. Business Insights and Storyboard

Story 1 — Overall performance: Sales and profit both show substantial month-to-month variation across the 2015–2018 period.

Story 2 — Category mix: Sales are distributed across seven major categories, with Eggs, Meat & Fish and Snacks at the top of the sales ranking in this dataset.

Story 3 — Regional mix: West and East contribute the largest sales totals, while North has very limited observations/value in this dataset.

Story 4 — Product focus: Health Drinks and Soft Drinks are the two highest-selling sub-categories.

Story 5 — Discount: Discount and profit are visualized together so that unusual patterns can be investigated before making pricing decisions.

Dashboard design choices: line chart for time trends; grouped bars for category/region comparison; horizontal bar chart for ranking; scatter plot for relationship analysis. The report avoids unnecessary chart types and uses labels/context to keep the story readable.
